Q-INTEL | TEAM COLLABORATION & PROJECT EXECUTION

Quick-Commerce Delivery Intelligence & Operations Engine

Project objective: Build a data-driven decision-support prototype that estimates delivery ETA, identifies late-order risk, explores geographic demand zones and presents operational insights through an interactive dashboard.

1. Team roles and responsibilities

Team member	Assigned role	Core responsibilities
Jajula Gnana Deepak 2300030263 | KLU	**ML Integration & Project Coordination**	Coordinate the end-to-end workflow; maintain project structure; integrate preprocessing, ETA and late-risk models, operational scoring and Streamlit demo; consolidate final submission.
Dhanisiri Koteswara Rao Path-3	**Data Engineering & EDA**	Own data profiling, cleaning decisions, missing-value handling, coordinate validation, feature engineering and exploratory/business insights; maintain data-quality evidence.
Anantula Sowmya Devi 2300060010 | KLU	**ETA Regression & Application**	Benchmark ETA regression candidates; evaluate MAE, RMSE and R^2; document the selected regressor; contribute to the order-input interface and ETA presentation.
Mohammed Saalif 2300031323 | KLU	**Late-Risk Classification**	Benchmark late-risk classifiers; evaluate precision, recall, F1 and AUC; support threshold analysis, confusion-matrix interpretation and risk-monitoring outputs.
G. Praneeth Path-3 (Observer)	**Review & Validation Support**	Observe project reviews; provide feedback on workflow clarity, map/dashboard usability and presentation; help check documentation and demo readiness.

2. Complete project workflow and shared engineering decisions

Data intake & quality
Cleaning, missing-value review, duplicate checks and GPS validation

>

Feature engineering & EDA
Time/calendar fields, distance features and business patterns

>

Chronological model evaluation
ETA regression and late-risk classification

>

Spatial & operational intelligence
Demand-zone clustering, risk scoring and recommendations

>

Streamlit demo & documentation
Interactive dashboard and final handover

Shared decisions

- **Prevent target leakage** by excluding post-outcome fields from order-time prediction.
- **Fit preprocessing on training data only;** select models and thresholds using validation data.
- **Reserve the test set** for final evaluation.
- **Flag invalid GPS** rather than fabricating locations.
- **Present cluster centres** as analytical references, not verified delivery boundaries or optimal store sites.

3. Final project deliverables

- Runnable Jupyter notebook and source modules
- Cleaned/model-ready data and quality evidence
- Regression/classification comparison tables and evaluation charts
- Saved model artifacts
- Demand-zone map and summaries
- Operational risk outputs
- Streamlit demonstration
- Business Report
- Business Solution
- README
- Team contribution record (this document)

4. Collaboration, review and accountability

The team uses modular ownership with shared integration reviews. Each member demonstrates their assigned module, explains its inputs/outputs and evaluation evidence, and supports end-to-end testing. Jajula Gnana Deepak consolidates interfaces and submission consistency; all members review the final notebook, dashboard, assumptions and presentation before handover.

Note: *Roles above are the proposed responsibility allocation for the team. Update individual contribution statements to match the work each member actually completed.*
